

Frontend Product Factory

What Is This?

An OpenCode skill that transforms your AI into a senior frontend engineer, product designer, and marketplace specialist. One prompt produces a commercial-grade frontend product — with design direction, animation, data architecture, and quality auditing baked in.

What's In The ZIP

```
frontend-product-factory/
├── .skills/                ← The OpenCode skill (core engine)
│   ├── SKILL.md           ← Main instruction set (7 laws, workflows, quality gates)
│   ├── opencode.json      ← Agent configuration (3 subagents)
│   ├── design/            ← 14 design reference files
│   ├── quality/           ← 5 quality gate checklists
│   ├── workflows/         ← 7 workflow guides
│   ├── marketplace/       ← 4 marketplace packaging files
│   └── caching/           ← 3 caching strategy files

│   └── Docs-Guide.pdf     ← This guide
├── Starter-Prompt.txt     ← Fill-in-the-blank project brief template
└── LICENSE                ← MIT License
```

Installation

1. Copy the `.skills/` folder into your OpenCode project root
2. Open OpenCode — the skill activates automatically
3. Use the Starter Prompt or just describe what you want

How To Use

One-Shot Mode (Recommended)

Just tell the AI what to build:

```
Build a cold-chain monitoring dashboard
```

The skill analyzes the name, infers design direction, and builds it. No questions asked.

Starter Prompt Mode

Open `Starter-Prompt.txt` and fill in the fields:

- **Project:** Name + one-sentence description
- **Type:** component, landing page, dashboard, UI kit, etc.
- **Audience:** Who uses this
- **Visual Personality:** 3-5 words (or leave blank for auto-inference)
- **Key Constraint:** Any limitations (zero dependencies, mobile-first, etc.)

Paste the filled prompt into OpenCode. The skill uses your brief to build exactly what you described.

The Seven Laws

The skill enforces 7 non-negotiable rules:

- 1. **Animation is Purposeful** — Motion serves a purpose, not decoration
- 2. **Choose the Right Data Display** — Cards, kanban, rich list, metrics, or tables — pick what fits the domain
- 3. **Anti-Generic Design** — No blacklisted fonts, colors, or layouts
- 4. **Data Visualization** — Dashboards must visualize data, not just display numbers
- 5. **Smart Tech Stack** — HTML/CSS/JS for components, React for templates/dashboards
- 6. **AI Slop Firewall** — 33-rule system to prevent generic AI output
- 7. **Data Architecture** — API-first frontend, realistic data contracts

Built-In Subagents

- **design-reviewer** — Visual audit, anti-slop compliance
- **code-auditor** — Code quality, performance, maintainability
- **productizer** — Marketplace packaging, documentation, screenshots

Quality Gates

Before delivery, every product passes through:

- Animation audit
- Data display validation
- Layout appropriateness check
- Anti-slop evaluation (6 stages)
- Code quality review
- Accessibility verification
- Responsive testing
- Build verification

File Reference

File	Purpose
.skills/SKILL.md	Core skill — 7 laws, patterns, quality gates
.skills/opencode.json	Agent config — 3 subagents
.skills/design/	Typography, color, motion, spacing, accessibility, responsive, landing pages, name inference, design diversity
.skills/quality/	Visual audit, code audit, accessibility audit, responsive audit, UX audit
.skills/workflows/	Component creation, UI kits, templates, productization, auditing
.skills/marketplace/	Documentation, packaging, compliance, screenshots
Starter-Prompt.txt	Fill-in-the-blank project brief template
LICENSE	MIT — commercial use allowed

Tips

- **Leave Visual Personality blank** — the skill infers from the project name
- **Leave Dials blank** — the skill auto-configures based on project type

- **One product per request** — don't combine multiple products in one prompt
- **The name matters** — "Fieldnote" tells the skill more than "build a dashboard"
